

Eastern Cancer Registration and Information Centre

Stage distribution of cancers diagnosed in 2009 in the East of England by cancer site and area of residence

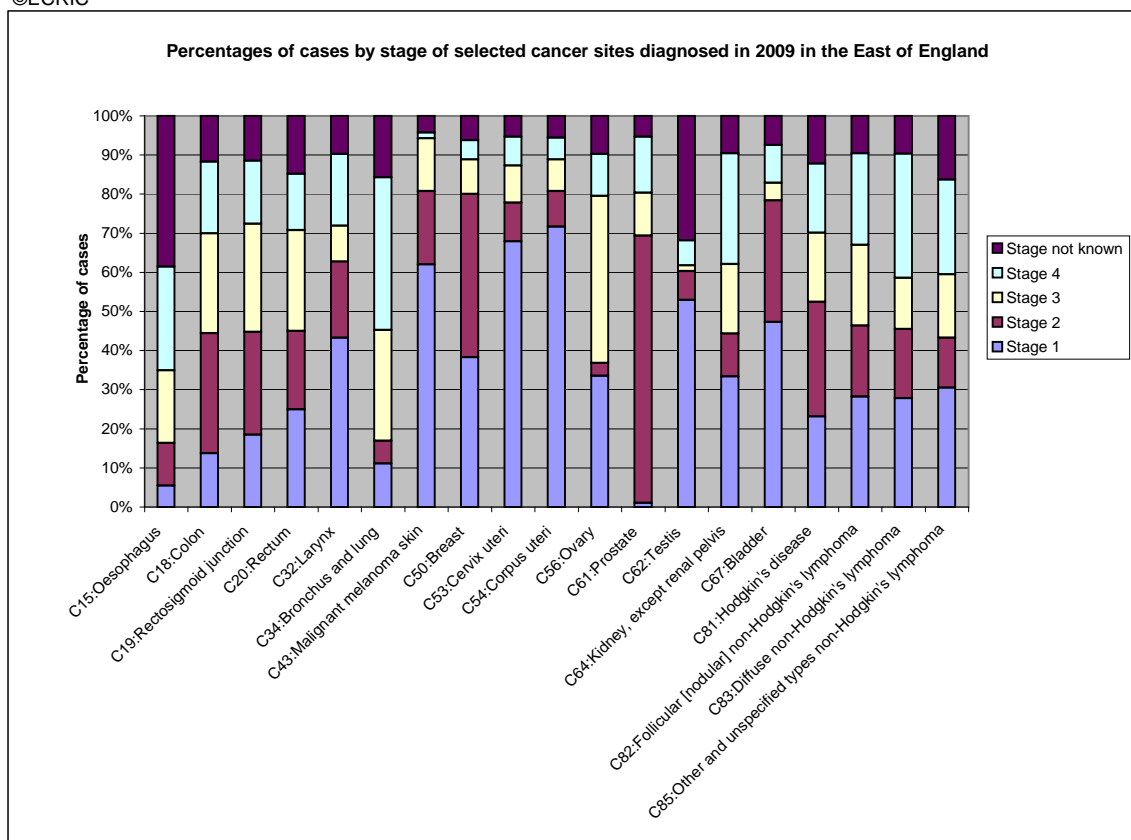

New diagnoses of cancer have a stage assigned by clinicians at the Eastern Cancer Registration and Information Centre (ECRIC), based on clinical and pathological data and patient notes. The stage of a cancer is an indication of how far along its natural history the cancer has progressed. ECRIC stages cancers at 42 of the 88 ICD10 malignant cancer sites.

These 42 stageable sites cover the majority of cancers, making up 80% of all malignancies excluding non-melanoma skin cancer. Stage at diagnosis is strongly associated with prognosis of cancer, with earlier stage diagnoses (Stage 1 or Stage 2) showing much better survival than cancers diagnosed at a later stage (Stage 3 or Stage 4). Insufficient information is available for ECRIC to assign a stage to a small proportion of cancers, with about 10% of potentially stageable cancers having an unknown stage; survival of these unknown stage cancers is generally between that for Stage 3 and Stage 4, so the unknown stage cancers can, on average, be assumed to be late diagnoses.

This report shows 1.) the stage distribution of the 19 most common cancers, 2.) the stage distribution by cancer network of residence of the 'Big Four' cancer groupings (Breast, Colorectal, Lung and Prostate), 3.) and 4.) the distribution of stage for all stageable cancers combined by Primary Care Trust and Local Authority of residence. Appendix 1 is a list of the ECRIC stageable cancer sites and Appendix 2 is a list of the hospitals of diagnosis of the majority of cancers in each Local Authority.

1. Incidence by stage of the most frequent stageable ICD10 cancer sites
